

# Ceph S3 - Placement Dynamique et Rétention Optimisée

Storage Classes, LUA et LifeCycle Policies

Frédéric Nass | Senior Ceph Engineer  
Octobre, 2025

# Content

01. **Classes de stockage**  
Placement targets & pools

02. **Placement dynamique**  
LUA scripting

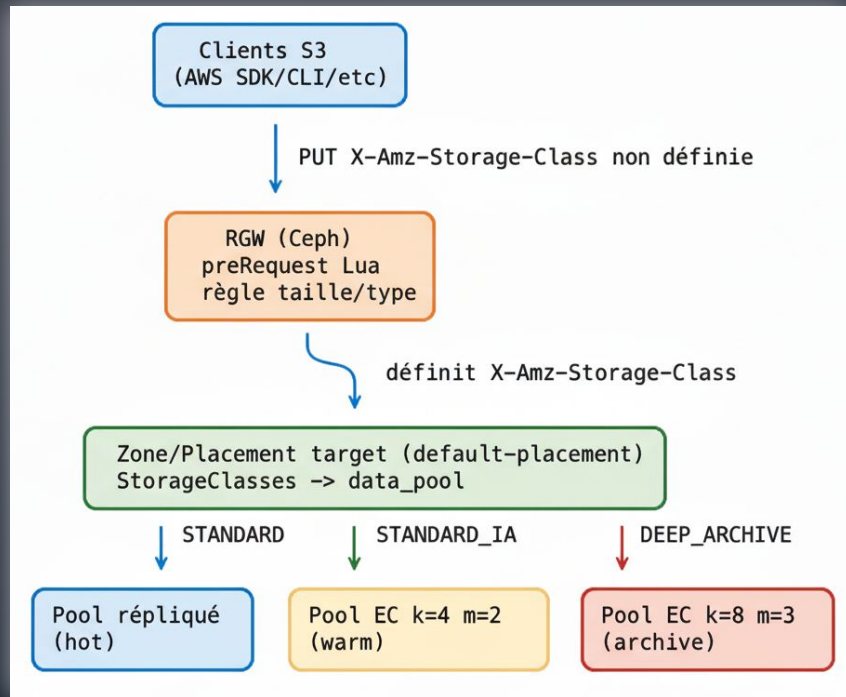

03. **Rétention optimisée**  
LifeCycle Policies

04. **Démo**  
Écriture d'objets S3

# Classes de stockage

- Une ou plusieurs dans un stockage S3
- Associées à un modèle de placement de donnée : replication, erasure coding, compression
- Optimisent le placement des objets S3 en fonction de différents critères : performance, fréquence d'accès, durabilité, coûts
- Le client S3 peut indiquer la classe de stockage qu'il souhaite utiliser pour son objet

Mais il ne la précise pas toujours...

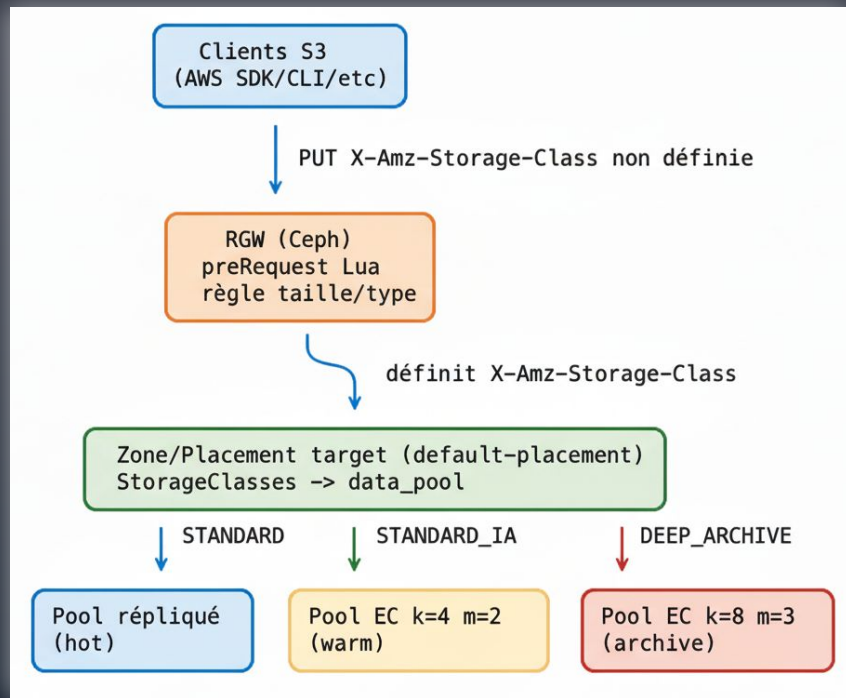

# Placement dynamique

...et si on le faisait à sa place ?

- Lorsque le client ne la précise pas
- Affecter automatiquement une classe de stockage à un objet en fonction :
  - du type d'objet (.mp4, .data, .pdf)
  - de la taille de l'objet (< 64kB, > 1MB)
  - du tenant (labo1, labo2)
  - du bucket (gros ou petits objets)
  - de la méthode d'upload (MPU ou pas)

L'efficacité de stockage et la performance d'accès seraient assurées dès l'écriture des données

# Placement dynamique - LUA Scripting

- Les passerelles S3 peuvent exécuter des scripts LUA à la volée en fonction du contexte (prerequisite, postrequest, background, getdata, putdata)
- Ces scripts LUA peuvent lire et modifier les métadonnées d'un objet avant de l'écrire

On peut donc dynamiquement définir ou modifier la classe de stockage d'un objet dès son écriture, selon certains critères

[docs.ceph.com/en/latest/radosgw/lua-scripting](https://docs.ceph.com/en/latest/radosgw/lua-scripting)

```
-- Rule line: STORAGECLASS;PATTERN;OP;BYTES;BUCKET;TENANT;OVERRIDE
-- OP in {<, <=, =, >=, >, *}
local function parse_rule(line, lineno)
    local parts = {}
    for field in string.gmatch(line, "([^\;]+)") do parts[#parts+1] =
trim(field) end
    if #parts < 1 then return nil end
    local bytes_num, bytes_pretty = parse_size(parts[4] or "0")
    local r = {
        storage_class = parts[1] or "",
        pattern       = (parts[2] ~= "" and parts[2]) or "*",
        op            = (parts[3] ~= "" and parts[3]) or "*",
        bytes         = bytes_num,
        bytes_str     = bytes_pretty,
        bucket        = (parts[5] ~= "" and parts[5]) or "*",
        tenant        = (parts[6] ~= "" and parts[6]) or "*",
        override      = to_bool(parts[7], false),
        lineno        = lineno
    }
    if r.storage_class == "" then return nil end
    return r
end

local function size_matches(op, threshold, content_len)
    if op == "*" then return true end
    if not content_len then return false end
    if op == "<" then return content_len < threshold end
    if op == "<=" then return content_len <= threshold end
    if op == ">" then return content_len > threshold end
    if op == ">=" then return content_len >= threshold end
    if op == "=" then return content_len == threshold end
    return false
end
```

# Rétention optimisée - Lifecycle Policies

- Les Lifecycle Policies assurent la transition d'objets S3 entre classes de stockage après un certain temps
- Les données les plus anciennes sont réécrites pour occuper moins de place dans le cluster

La règle ci-contre :

- nettoie les MPU parts à 10 jours
- déplace les objets vers DEEP\_ARCHIVE mappée au pool EC 8+3 à 30 jours
- supprime les objets à 365 jours

```

# DEMO

Placement dynamique et rétention optimisée

# Configuration du service RGW (S3)

## Creation des pools ceph

```
ceph osd erasure-code-profile set ec42 k=4 m=2
ceph osd erasure-code-profile set ec83 k=8 m=3

ceph osd pool create s3.hot.data 256 256 replicated
ceph osd pool create s3.warm.data 128 128 erasure ec42
ceph osd pool create s3.archive.data 64 64 erasure ec83

ceph osd pool application enable s3.hot.data rgw
ceph osd pool application enable s3.warm.data rgw
ceph osd pool application enable s3.archive.data rgw
```

## Ajout des Storage Classes et Storage Class par défaut

```
radosgw-admin zonegroup placement add --rgw-zonegroup france
--placement-id default-placement --storage-class STANDARD_IA

radosgw-admin zonegroup placement add --rgw-zonegroup france
--placement-id default-placement --storage-class DEEP_ARCHIVE

radosgw-admin zonegroup placement default --rgw-zonegroup france
--placement-id default-placement --storage-class STANDARD_IA

radosgw-admin zonegroup get | grep default_placement
    "default_placement": "default-placement/STANDARD_IA"

radosgw-admin period update --commit
```

## Vérification

```
radosgw-admin zone placement list
[
  {
    "key": "default-placement",
    "val": {
      "index_pool": "s3.buckets.index",
      "storage_classes": {
        "DEEP_ARCHIVE": {
          "data_pool": "s3.archive.data",
          "compression_type": "zstd"
        },
        "STANDARD": {
          "data_pool": "s3.hot.data"
        },
        "STANDARD_IA": {
          "data_pool": "s3.warm.data",
          "compression_type": "lz4"
        }
      },
      "data_extra_pool": "s3.buckets.non-ec",
      "index_type": 0,
      "inline_data": true
    }
  }
]
```

# Configuration du service RGW (S3)

Renseigner les data\_pool (et index/non-ec) côté zone

```
# STANDARD est déjà présente; s'assurer qu'elle pointe vers le pool répliqué "hot"
radosgw-admin zone placement add --rgw-zone nancy \
  --placement-id default-placement \
  --storage-class STANDARD \
  --data-pool s3.hot.data \
  --index-pool s3.buckets.index \
  --data-extra-pool s3.buckets.non-ec

# STANDARD_IA -> EC 4+2
radosgw-admin zone placement add --rgw-zone nancy \
  --placement-id default-placement \
  --storage-class STANDARD_IA \
  --data-pool s3.warm.data \
  --compression lz4

# DEEP_ARCHIVE -> EC 8+3
radosgw-admin zone placement add --rgw-zone nancy \
  --placement-id default-placement \
  --storage-class DEEP_ARCHIVE \
  --data-pool s3.archive.data \
  --compression zstd
```

Appliquer la configuration

```
radosgw-admin period update --commit
```

# Configuration du service RGW (S3)

Modifier la configuration du service RGW

```
$ ceph orch ls --export --service_type=rgw --format yaml > rgw.yaml

$ vim rgw.yaml
service_type: rgw
service_id: monde-france-nancy
service_name: rgw.monde-france-nancy
placement:
  count: 1
  label: rgws_nancy
spec:
  rgw_frontend_port: 8080
  rgw_realm: monde
  rgw_zone: nancy
  rgw_zonegroup: france
custom_configs:
  - mount_path: /etc/ceph/rgw_storageclass_rules.conf
    content: |
      # Paramètres globaux MPU
      mpu_default_class=DEEP_ARCHIVE
      mpu_force=true

      # Paramètres globaux défaut non-MPU
      default_class=STANDARD_IA
      default_force=false

      # Règles PUT objet (non-MPU)
      # STORAGECLASS;PATTERN;OP;BYTES;BUCKET;TENANT;OVERRIDE
      #STANDARD_IA;%.pdf;*;0;*;true
      #INTELLIGENT_TIERING;*;<;32768;bucket-logs;*;true
      #ONEZONE_IA;%.eml;*;0;*;tenant-a;false
      #GLACIER;%.iso;<;1073741824;media-bucket;*;true

      STANDARD;*;<=;2MiB;*;true
      DEEP_ARCHIVE;%.data;*;0B;*;true
```

Appliquer la configuration et redéployer les RGWs

```
$ ceph orch apply -i rgw.yaml
Scheduled rgw.monde-france-metz update...
Scheduled rgw.monde-france-nancy update...

$ ceph orch redeploy rgw.monde-france-nancy
Scheduled to redeploy rgw.monde-france-nancy.r03h01.veyyjq on host 'r03h01'
```

## Vérification

```
$ container_id=$(ssh -n r03h01 podman ps | grep rgw | awk '{print $1}')

$ ssh -n r03h01 podman exec -it $container_id cat
/etc/ceph/rgw_storageclass_rules.conf
# Paramètres globaux MPU
mpu_default_class=DEEP_ARCHIVE
mpu_force=true

# Paramètres globaux défaut non-MPU
default_class=STANDARD_IA
default_force=false

# Règles PUT objet (non-MPU)

#STANDARD_IA;%.pdf;*;0;*;true
#INTELLIGENT_TIERING;*;<;32768;bucket-logs;*;true
#ONEZONE_IA;%.eml;*;0;*;tenant-a;false
#GLACIER;%.iso;<;1073741824;media-bucket;*;true

STANDARD;*;<=;2MiB;*;true
DEEP_ARCHIVE;%.data;*;0B;*;true
```

# Configuration du service RGW (S3)

Téléchargement du script LUA [github.com/frednass/s3-dynamic-placement-and-archiving](https://github.com/frednass/s3-dynamic-placement-and-archiving)

```
$ curl -k -s https://raw.githubusercontent.com/frednass/s3-dynamic-placement-and-archiving/refs/heads/main/rgw_storageclass_rules.lua -o rgw_storageclass_rules.lua  
$radosgw-admin script put --infile=./rgw_storageclass_rules.lua --context=preRequest
```

Ajout du script LUA à la Rados Gateway (RGW)

```
$ curl -k -s https://raw.githubusercontent.com/frednass/s3-dynamic-placement-and-archiving/refs/heads/main/rgw_storageclass_rules.lua -o rgw_storageclass_rules.lua  
$radosgw-admin script put --infile=./rgw_storageclass_rules.lua --context=preRequest
```

# Application de la Lifecycle Policy S3

## Création du bucket

```
$ rclone mkdir s3:/newbucket2
```

## Ajouter la Lifecycle Policy au bucket test

```
$ aws s3api put-bucket-lifecycle-configuration \
--endpoint http://10.38.1.59:8080 \
--bucket newbucket2 \
--lifecycle-configuration file://lifecycle.json
```

## Créer la Lifecycle Policy

```
$ vim lifecycle.json
{
  "Rules": [
    {
      "Filter": {
        "Prefix": ""
      },
      "Status": "Enabled",
      "Transitions": [
        {
          "Days": 30,
          "StorageClass": "DEEP_ARCHIVE"
        }
      ],
      "AbortIncompleteMultipartUpload": {
        "DaysAfterInitiation": 10
      },
      "Expiration": {
        "Days": 365
      },
      "ID": "double transition and expiration"
    }
  ]
}
```

## Vérifier son application

```
$ aws s3api --endpoint http://10.38.1.59:8080 get-bucket-lifecycle-configuration
--bucket newbucket2
{
  "Rules": [
    {
      "Expiration": {
        "Days": 365
      },
      "ID": "double transition and expiration",
      "Prefix": "",
      "Status": "Enabled",
      "Transitions": [
        {
          "Days": 30,
          "StorageClass": "DEEP_ARCHIVE"
        }
      ],
      "AbortIncompleteMultipartUpload": {
        "DaysAfterInitiation": 10
      }
    }
  ]
}
```

# Application de la Lifecycle Policy S3

Vérifier sa prise en charge

```
$ radosgw-admin lc list
[
  {
    "bucket":
":newbucket2:f50809af-d67e-426c-bccd-78f8ff6af983.1276537.1",
    "shard": "lc.6",
    "started": "Thu, 01 Jan 1970 00:00:00 GMT",
    "status": "UNINITIAL"
  }
]
```

Déclencher manuellement son exécution

```
$ radosgw-admin lc process
$ radosgw-admin lc list
[
  {
    "bucket":
":newbucket2:f50809af-d67e-426c-bccd-78f8ff6af983.1276537.1",
    "shard": "lc.6",
    "started": "Sun, 28 Sep 2025 09:10:43 GMT",
    "status": "COMPLETE"
  }
]
```

# Vérification du placement dynamique

Augmenter le niveau de debug

```
$ ceph config set global debug_rgw 20
```

Surveiller les pools

```
Every 2.0s: rados df | grep -i -E 's3.*data|objects' ; echo ---- ; ceph df | grep -i -E 'objects|s3.*data' r01h01: Mon Sep 29 09:02:20 2025
```

POOL_NAME	USED	OBJECTS	CLONES	COPIES	MISSING_ON_PRIMARY	UNFOUND	DEGRADED	RD_OPS	RD	WR_OPS	WR	USED	COMPR	UNDER	COMPR

# Remerciements

- Yuval Lifshitz for adding Lua scripting into the Rados Object Gateway
- Steven Umbehocker (OSNEXUS) for [his work](#) on RGW autotiering that inspired this presentation
- Anthony D'Atri and Curt Bruns [talk](#) on RGW Lua scripting

## Questions ?
